

FFPLAY

FFPLAY comes bundled with the ffmpeg download. The ffplay is a simple to use command line app for playing the extracted streams that you have just created.

The simple use of ffplay is just:

```
ffplay filename.mp4
```

However, the issue with UHD streams is that they are larger than most monitors, so it is generally necessary to either rescale the output, or force it to fullscreen.

To replay a video in a window.

```
ffplay -i video.mpg -vf scale=800x600
```

This will replay the selected file at a window size of 800x600. Remember, currently (End 2016) UHD streams play very poorly and you will only get 1 or 2 frames per second.

To replay a video full screen.

```
ffplay -i video.mpg -vs
```

This will replay the video at fullscreen resolution.
