

Set the AMI

Aug 2017

Standard AMI

An AMI is an Amazon Machine Image. This is a list of Operating Systems that you can have automatically installed when you create an EC2 Instance. See a small AMI list below:

The screenshot shows the AWS Management Console interface for selecting an Amazon Machine Image (AMI). The page is titled "Step 1: Choose an Amazon Machine Image (AMI)" and includes a "Cancel and Exit" link. Below the title, there is a "Quick Start" section with a "Free tier only" filter. The main content area displays a list of AMIs, each with a logo, name, description, root device type, virtualization type, and a "Select" button. The AMI IDs are highlighted in red boxes:

- Amazon Linux AMI 2017.03.1 (HVM), SSD Volume Type (ami-ed100689)
- SUSE Linux Enterprise Server 12 SP2 (HVM), SSD Volume Type (ami-a9eae0cd)
- Red Hat Enterprise Linux 7.3 (HVM), SSD Volume Type (ami-40a8bf24)
- Ubuntu Server 16.04 LTS (HVM), SSD Volume Type (ami-996372fd)
- Microsoft Windows Server 2016 Base (ami-5a80963e)
- Microsoft Windows Server 2016 Base with Containers (ami-5c8e9838)

I have not found anywhere that lists all of the available AMIs and their IDs, I can see why because it is a rather long list and AMI numbers change between AZs as well (make note of that, your script will **not work** in any AZ just by changing the region value, you will need the AMI value for that region as well.)
