

# Start a New Script

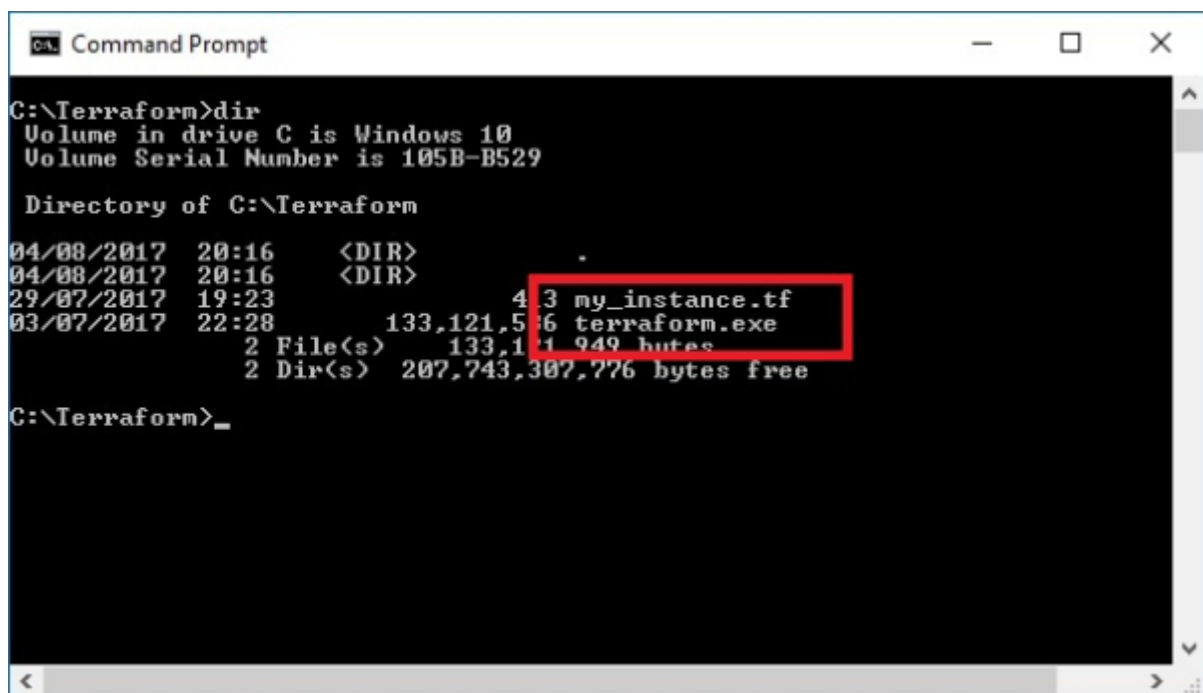

Aug 2017

As Terraform is a very small file (by todays standards) I generally create a new folder, and put the Terraform.exe executable in to that folder. I then keep Terraform and my script in that folder, creating a new folder containing a copy of Terraform for each script.

This is useful as Terraform creates other files to do with your scripts, and having lots of these in a single folder can be quite frustrating.

For this example, please do the following:

1. Create a new folder
2. Copy the Terraform.exe in to your new folder
3. Create a new file in your preferred text editor and save it as "my\_instance.tf"

```
Command Prompt

C:\Terraform>dir
Volume in drive C is Windows 10
Volume Serial Number is 105B-B529

Directory of C:\Terraform

04/08/2017  20:16    <DIR>          .
04/08/2017  20:16    <DIR>          ..
29/07/2017  19:23             43 my_instance.tf
03/07/2017  22:28    133,121,536 terraform.exe
               2 File(s)      133,121,536 bytes
               2 Dir(s)      207,743,307,776 bytes free

C:\Terraform>_
```
